THE COMMUNICATION PROBLEM

Campus communication has a noise problem.

Notification overload too many alerts bury what matters

Lack of personalization one message does not fit all

Delivery failures network and provider issues cause missed notifications

Duplicate notifications retries risk sending duplicates

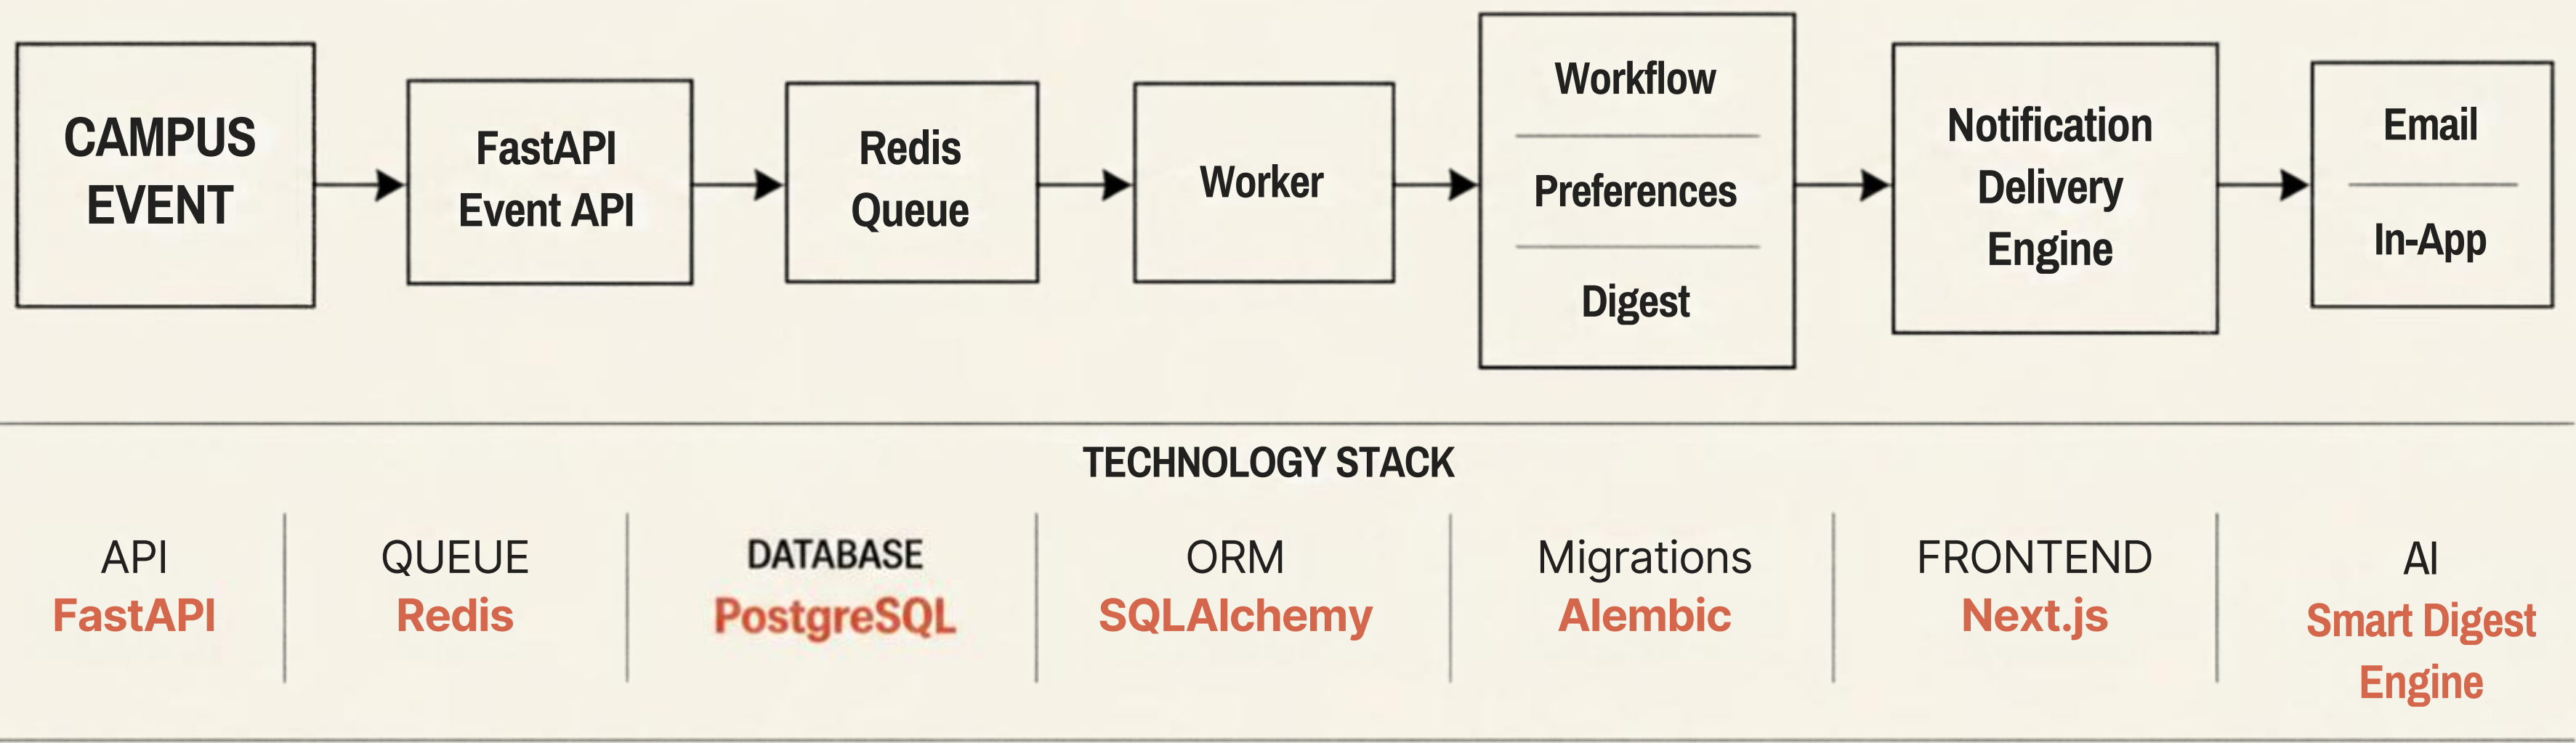

Poor digesting related events should form meaningful summaries

WHAT IF?

campus notifications **acted as an intelligent, reliable system** instead of isolated alerts?

Event-to-Delivery Architecture

An asynchronous, preference-aware pipeline for reliable, personalized notifications.

From event to inbox **intelligently, reliably, everywhere.**

What Makes The Herald Different

Multi-channel delivery

Reach users where they prefer—
email and in-app.

One event, many recipients

A single event fans out to
the people who need it.

Smart digests that matter

Related events are grouped into one concise,
actionable summary.

**BUILT FOR
RELIABILITY +
INTELLIGENCE**

Preference-aware delivery

We respect user preferences and
skip disabled channels.

Reliable retries, no duplicates

Controlled retries deliver successfully without
duplicate notifications.

Atomic protection

Prevents multiple digest creations
in parallel for consistent results.

AI-powered digests

Intelligent summaries highlight what's important with clear, actionable
information.

The Proof — Three Killer Tests

01

Digest Grouping

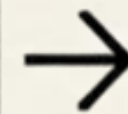

Ten events within five minutes become one consolidated digest.

02

Preference Filtering

With email off and in-app on, email is skipped and in-app delivered.

03

Retry Without Duplicates

If the first attempt fails, a retry succeeds and only one final notification is delivered.

Reliability, personalization, and efficiency proven in real-world tests.
